

CERTIFICATE

This is to certify that the work contained in the major project report entitled, “**Multiple Object Tracking employing Optimal Parametric Estimation**” Submitted by **Ajay Kumar (Roll No. 2K11/SPD/02)** of Delhi Technological University in the partial fulfillment of the requirement for the degree of Master of Technology in Electronics & Communication Department with specialization in ‘Signal Processing and Digital Design’, is a bonafide work carried out under my guidance and supervision in the academic year 2011-2013.

The work embodied in this dissertation has not been submitted for the award of any other degree to the best of my knowledge.

Date: July 2013

Prof. Rajiv Kapoor

HOD

Department of Electronics & Communication Engineering

Delhi Technological University

Delhi-110042

ACKNOWLEDGEMENT

It is a great pleasure to have the opportunity to extend my heartiest felt gratitude to everybody who helped me throughout the course of this project. It is distinct pleasure to express my deep sense of gratitude and indebtedness to my learned supervisor Prof. Rajiv Kapoor for their invaluable guidance, encouragement and patient reviews. He kept on boosting me with time, to put an extra ounce of effort to realize this work. With his continuous inspiration only, it has become possible to complete this dissertation. I would also like to take this opportunity to present my sincere regards to all the faculty members of the department for their support and encouragement.

I am grateful to my parents, jiju, didi, and my niece “Vaani”, for their love and moral support all the time, they have been always around to cheer me up in the odd times of this work. I am also thankful to all my friends especially Akash, Richa, Deependra and Naveen for their unconditional care, support and motivation during this work.

Ajay Kumar

M.Tech. (Signal Processing & Digital Design)

Roll No. 2K11/SPD/02

Department of Electronics & Communication Engineering

Delhi Technological University, New-Delhi-110042

ABSTRACT

The area of Object Tracking is of immense interest due to its application in automated surveillance, motion based recognition, pedestrian monitoring, human computer interaction. Visual tracking is the process of repeated estimation of the state of an object in the next frame, given states in previous frames. Object identification is one of the initial, but paramount steps in object tracking. It is basically, determination of video statistics, object classification, determination of inconsistencies, and then finally human identification. Every object has its unique features in a video scene. These unique features help us to determine whether the object is same in the next frame of a video as we need to track or not. In our project we have first extracted those features using communication theory, or radar theory to be precise. This enriches us with the crucial estimated features of the objects. After this parametric estimation, we have calculated the optimum detection probabilities for the target object using Neyman Pearson Theory. Considering the decision probabilities, the miss probability, the false probability, the detection probability and the minimized cost function, determined using Neyman Pearson Theory, we identify the target object.
