 Maximum Marks: 20

**EE- 322 ADVANCED ANALOG CIRCUIT DESIGN**

Note: Answer any SEVEN questions.  
 All questions carry equal marks.  
 Assume suitable value for missing data (if any).

- 1 Determine the output resistance of the modified Wilson current mirror circuit given below. 03

- 2 With the help of current mirrors realize the following types of current sources where the point P can be at arbitrary potential. 02

- 3 Draw the complete circuit of the output stage of the op-amp IC741 (without the short-circuit protection transistors and resistors). Using appropriate analysis determine the bias current (collector) for all the transistors used in the output stage. Take  $I_{Ref} = 720 \mu A$ ,  $\beta_{PNP} = 50$  and  $\beta_{NPN} = 200$ ,  $I_{s14} = I_{s20} = 3 \times 10^{-16} A$ . 2.5

-164-

P.T.C

5 Explain the translinear circuit principle as applicable for circuits consisting of BJTs. Using this principle determine the value of  $\frac{I_{o2}-I_{o1}}{I_{I2}-I_{I1}}$ , for the circuit shown below. 03

6 Determine the output current  $I_{O1}$  for the circuit shown below. 02

- (a) Supply current sensing method
- (b) Slew rate phenomenon in Operational amplifiers
- (c) Cascode current mirror
- (d) Instrumentation amplifier design using the supply current sensing method
